Editorial

Dear Smart Cities Marketplace Community,

Welcome to the Smart Cities Marketplace newsletter! The guest editorial below is the last one in a series of editorials from like-minded EC initiatives. This one is from our friends of the Clean energy for EU islands secretariat.

The timing for this guest editorial could not be better. At this very moment, islanders and city dwellers are both experiencing an energy shock that marks the end of a period and, perhaps, the start of a new destiny. Islands and cities could not have started more differently: throughout history, the remoteness and isolation of islands contrasted with the connectivity of the cities, which were founded where transport was easy and trade abundant.

In energy terms, islands in the last century had to make do with what could be produced or stored remotely - wood, coal and petrol - whereas cities were at the centre of dense networks of electricity and gas. Yet now, the terrible Russian invasion in Ukraine has precisely made those networks more vulnerable and expensive. The European mainland cities are starting to look like islands, at constant risk of being shut off. And that is where our common destiny is taking shape. Because at the same time, cheap renewable energy and batteries are opening up a future of decentralised, community-led energy systems.

Local renewable energy is being shared through EV charging systems and

energy communities. Island energy utilities and Stadtwerke are both being repowered for an energy-independent, net zero future. "City air makes you free", the saying goes - and I, for one, cherish urban living. But having visited climate-neutral Samsoe island while Putin was further reducing the gas supply, I could not help but think only decentralised, community-led clean energy will really set us free.

Jan Cornillie, Project Coordinator, Clean energy for EU islands secretariat
